Tilt Assist Explained

The Solara® 3G wheelchair is shipped from the factory pre-configured with one of three "Tilt Assist" settings: Front, Mid or Rear, based solely on the seat depth range and seat depth ordered. This setting describes how the user's weight is distributed on the frame itself, i.e., does one front load the chair, rear load or is the weight evenly distributed. As compared to the 2G, the 3G requires up to 30% less force needed to tilt because of these settings. If factors other than seat depth or seat depth range come into play that affect the weight distribution of the chair, the provider has the ability to change the Tilt Assist setting in the field by simply adjusting 2 screws on each side of the frame

Tilt Assist Factory Setting

When adjusting the Tilt Assist there are 4 bolts to change (2 on each side.) See the illustration to the left and chart above

\$79

\$64

The Rear setting has the rocker tube telescoped entirely into the seat frame support tube where the adjustment bolt is in the bottom hole. Along the base frame the bolt is in the top hole. (e.g. accommodates a seat depth that is in the highest end of the seat depth range)

For the Mid setting the adjustment bolt is simply in the middle hole along the rocker tube which telescopes out and the middle hole along the base frame. (e.g. optimal for a seat depth in the middle of the seat depth range)

The Front setting has the bolt in the top hole of the rocker tube which is fully telescoped out of the seat frame support tube and in the bottom hole along the base frame. (e.g. accommodates a seat depth in the lowest end of the seat depth range)
